Simplified LRFD Bridge Design Jai B. Kim, Robert H. Kim, Jonathan Eberle, 2013-04-08 Developed to comply with the fifth edition of the AASHTO LRFD Bridge Design Specifications 2010 Simplified LRFD Bridge Design is How To use the Specifications book Most engineering books utilize traditional deductive practices beginning with in depth theories and progressing to the application of theories The inductive method in the book uses alternative approaches literally teaching backwards The book introduces topics by presenting specific design examples Theories can be understood by students because they appear in the text only after specific design examples are presented establishing the need to know theories The emphasis of the book is on step by step design procedures of highway bridges by the LRFD method and How to Use the AASHTO Specifications to solve design problems Some of the design examples and practice problems covered include Load combinations and load factors Strength limit states for superstructure design Design

Live Load HL 93 Un factored and Factored Design Loads Fatigue Limit State and fatigue life Service Limit State Number of design lanes Multiple presence factor of live load Dynamic load allowance Distribution of Live Loads per Lane Wind Loads Earthquake Loads Plastic moment capacity of composite steel concrete beam LRFR Load Rating Simplified LRFD Bridge Design is a study guide for engineers preparing for the PE examination as well as a classroom text for civil engineering students and a reference for practicing engineers Eight design examples and three practice problems describe and introduce the use of articles tables and figures from the AASHTO LRFD Bridge Design Specifications Whenever articles tables and figures in examples appear throughout the text AASHTO LRFD specification numbers are also cited so that users can cross reference the material

Impact of AASHTO LRFD Bridge Design Specifications on the Design of Type C and AASHTO Type IV Girder Bridges Safiuddin Adil Mohammed, 2007 This research study is aimed at assisting the Texas Department of Transportation TxDOT in making a transition from the use of the AASHTO Standard Specifications for Highway Bridges to the AASHTO LRFD Bridge Design Specifications for the design of prestressed concrete bridges It was identified that Type C and AASHTO Type IV are among the most common girder types used by TxDOT for prestressed concrete bridges This study is specific to these two types of bridges Guidelines are provided to tailor TxDOT's design practices to meet the requirements of the LRFD Specifications Detailed design examples for an AASHTO Type IV girder using both the AASHTO Standard Specifications and AASHTO LRFD Specifications are developed and compared These examples will serve as a reference for TxDOT bridge design engineers A parametric study for AASHTO Type IV and Type C girders is conducted using span length girder spacing and strand diameter as the major parameters that are varied Based on the results obtained from the parametric study two critical areas are identified where significant changes in design results are observed when comparing Standard and LRFD designs The critical areas are the transverse shear requirements and interface shear requirements and these are further investigated The interface shear reinforcement requirements are observed to increase significantly when the LRFD Specifications are used for design New provisions for interface shear design that have been proposed to be included in the LRFD Specifications in 2007 were evaluated It was observed that the proposed interface shear provisions will significantly reduce the difference between the interface shear reinforcement requirements for corresponding Standard and LRFD designs The transverse shear reinforcement requirements are found to be varying marginally in some cases and significantly in most of the cases when comparing LRFD designs to Standard designs The variation in the transverse shear reinforcement requirement is attributed to differences in the shear models used in the two specifications The LRFD Specifications use a variable truss analogy based on the Modified Compression Field Theory MCFT The Standard Specifications use a constant 45 degree truss analogy method for its shear design provisions The two methodologies are compared and major differences are noted

restrictive debonding percentages and the limitations of approximate method of load distribution The current LRFD provisions of debonding percentage of 25 percent per section and 40 percent per row will pose serious restrictions on the design of Texas U54 bridges This will limit the span capability for the designs incorporating normal strength concretes Based on previous research and successful past practice by TxDOT it was recommended that up to 75% of the strands may be debonded if certain conditions are met The provisions given in the LRFD Specifications for the approximate load distribution are subject to certain limitations of span length edge distance parameter e and number of beams If these limitations are violated the actual load distribution should be determined by refined analysis methods During the parametric study several of these limitations were found to be restrictive for typical Texas U54 beam bridges Two cases with span lengths of 140 ft and 150 ft and a 60 degree skew were investigated by grillage analysis method
