Torregrosa, Alicia Cordero, Fazlollah Soleymani, 2019-12-06 Solving nonlinear equations in Banach spaces real or complex nonlinear equations nonlinear systems and nonlinear matrix equations among others is a non trivial task that

involves many areas of science and technology Usually the solution is not directly affordable and require an approach using iterative algorithms This Special Issue focuses mainly on the design analysis of convergence and stability of new schemes for solving nonlinear problems and their application to practical problems Included papers study the following topics Methods for finding simple or multiple roots either with or without derivatives iterative methods for approximating different generalized inverses real or complex dynamics associated to the rational functions resulting from the application of an iterative method on a polynomial Additionally the analysis of the convergence has been carried out by means of different sufficient conditions assuring the local semilocal or global convergence This Special issue has allowed us to present the latest research results in the area of iterative processes for solving nonlinear equations as well as systems and matrix equations In addition to the theoretical papers several manuscripts on signal processing nonlinear integral equations or partial differential equations reveal the connection between iterative methods and other branches of science and engineering

Multi-Valued and Universal Binary Neurons Igor Aizenberg,Naum N. Aizenberg,Joos P.L. Vandewalle,2013-03-14 Multi Valued and Universal Binary Neurons deals with two new types of neurons multi valued neurons and universal binary neurons These neurons are based on complex number arithmetic and are hence much more powerful than the typical neurons used in artificial neural networks Therefore networks with such neurons exhibit a broad functionality They can not only realise threshold input output maps but can also implement any arbitrary Boolean function Two learning methods are presented whereby these networks can be trained easily The broad applicability of these networks is proven by several case studies in different fields of application image processing edge detection image enhancement super resolution pattern recognition face recognition and prediction The book is hence partitioned into three almost equally sized parts a mathematical study of the unique features of these new neurons learning of networks of such neurons and application of such neural networks Most of this work was developed by the first two authors over a period of more than 10 years and was only available in the Russian literature With this book we present the first comprehensive treatment of this important class of neural networks in the open Western literature Multi Valued and Universal Binary Neurons is intended for anyone with a scholarly interest in neural network theory applications and learning It will also be of interest to researchers and practitioners in the fields of image processing pattern recognition control and robotics

A History of Complex Dynamics

Daniel S. Alexander, 2013-06-29 In late 1917 Pierre Fatou and Gaston Julia each announced several results regarding the iteration of rational functions of a single complex variable in the Comptes rendus of the French Academy of Sciences. These brief notes were the tip of an iceberg. In 1918 Julia published a long and fascinating treatise on the subject which was followed in 1919 by an equally remarkable study, the first installment of a three-part memoir by Fatou. Together these works form the bedrock of the contemporary study of complex dynamics. This book had its genesis in a question put to me by Paul Blanchard: Why did Fatou and Julia decide to study iteration? As it turns out, there is a very simple answer. In 1915 the French Academy of Sciences announced that it would award its 1918 Grand Prix des Sciences mathématiques for the study of iteration. However, like many simple answers, this one doesn't get at the whole truth and in fact leaves us with another equally interesting question: Why did the Academy offer such a prize? This study attempts to answer that last question, and the answer I found was not the obvious one that came to mind, namely that the Academy's interest in iteration was prompted by Henri Poincaré's use of iteration in his studies of celestial mechanics. *Advances in Nuclear Science and Technology* Jeffery

Lewins, Martin Becker, 2006-04-18 Some countries have moved beyond the design and operation of nuclear electricity generating systems to confronting the issue of nuclear waste disposal; while others are still committed to further nuclear facility construction. Volume 24 chronicles these key developments and examines nuclear reactor accidents at Chernobyl, Bhopal, and TMI. The text also analyzes current international knowledge of neutron interactions, deterministic methods based on mean values for assessing radiation distributions, practical applications of the TIBERE models to explicit computation of leakage terms in realistic reactor geometry, and a technique to deal with the issues of finance, risk assessment, and public perception. **Numerical Methods for Experimental Mechanics** Donald Berghaus, 2013-11-27 The purpose of this book

is to place a resource in the hands of experimental mechanics researchers to enable them to understand and to obtain a working familiarity with certain of the numerical methods particularly useful to the field. The book is organized to permit readers to study the methods and to observe their application in experimental problems. It is also intended to encourage readers to directly apply the methods to the same problems or to similar problems of their choosing. To this end, computer programs are available electronically together with data for easy application. Program listings are given in the appendix. There are four chapters which make up the central coverage of the text. The first of these deals with least square methods of problem solution, both for curve fitting and for general solution of overdetermined problems. Nonlinear least squares methods are included. Secondly, splines, specifically smoothed splines, are covered, including specification of boundary conditions for the latter. Use for differentiation is emphasized with attention to control of possible excesses in smoothing. Transform methods are the third major area covered, both the Discrete Fourier Transform and the Fast Fourier Transform. Their combined use is described for appropriate problems. Finally, digital filters are included, principally the Butterworth low pass filter. Coverage also includes different filter orders, high pass filters, and the two-pass filter technique. The author has had experience with the

four areas covered and with all of the example problems described in the text

Complex-Valued Neural Networks with Multi-Valued Neurons Igor Aizenberg, 2011-06-24 Complex Valued Neural Networks have higher functionality learn faster and generalize better than their real valued counterparts This book is devoted to the Multi Valued Neuron MVN and MVN based neural networks It contains a comprehensive observation of MVN theory its learning and applications MVN is a complex valued neuron whose inputs and output are located on the unit circle Its activation function is a function only of argument phase of the weighted sum MVN derivative free learning is based on the error correction rule A single MVN can learn those input output mappings that are non linearly separable in the real domain Such classical non linearly separable problems as XOR and Parity n are the simplest that can be learned by a single MVN Another important advantage of MVN is a proper treatment of the phase information These properties of MVN become even more remarkable when this neuron is used as a basic one in neural networks The Multilayer Neural Network based on Multi Valued Neurons MLMVN is an MVN based feedforward neural network Its backpropagation learning algorithm is derivative free and based on the error correction rule It does not suffer from the local minima phenomenon MLMVN outperforms many other machine learning techniques in terms of learning speed network complexity and generalization capability when solving both benchmark and real world classification and prediction problems Another interesting application of MVN is its use as a basic neuron in multi state associative memories The book is addressed to those readers who develop theoretical fundamentals of neural networks and use neural networks for solving various real world problems It should also be very suitable for Ph D and graduate students pursuing their degrees in computational intelligence

a c 9 h In presenting this monograph I would like to indicate both its orientation as well as my personal reasons for being interested in discrete iterations that is iterations on a generally very large finite set While working in numerical analysis I have been interested in two main aspects the algorithmic aspect an iterative algorithm is a mathematical entity which behaves in a dynamic fashion Even if it is started far from a solution it will often tend to get closer and closer the mathematical aspect this consists of a coherent and rigorous analysis of convergence with the aid of mathematical tools these tools are mainly the use of norms for convergence proofs the use of matrix algebra and so on One may for example refer to the algorithmic and mathematical aspects of Newton's method in $\mathbb{R}^n$ as well as to the QR algorithm for eigenvalues of matrices These two algorithms seem to me to be the most fascinating algorithms in numerical analysis since both show a remarkable practical efficiency even though there exist relatively few global convergence results for them

[Early Days in Complex Dynamics](#) Daniel S. Alexander, Felice Iavernaro, Alessandro Rosa, 2012 The theory of complex dynamics whose roots lie in 19th century studies of the iteration of complex function conducted by Koenigs Schoder and others flourished

remarkably during the first half of the 20th century when many of the central ideas and techniques of the subject developed. This book by Alexander Iavarnaro and Rosa paints a robust picture of the field of complex dynamics between 1906 and 1942 through detailed discussions of the work of Fatou, Julia, Siegel and several others. A recurrent theme of the authors' treatment is the center problem in complex dynamics. They present its complete history during this period and in so doing bring out analogies between complex dynamics and the study of differential equations in particular the problem of stability in Hamiltonian systems. Among these analogies are the use of iteration and problems involving small divisors which the authors examine in the work of Poincaré and others linking them to complex dynamics principally via the work of Samuel Lattes in the early 1900s and Jürgen Moser in the 1960s. Many details will be new to the reader such as a history of Lattes functions, functions whose Julia set equals the Riemann sphere, complex dynamics in the United States around the time of World War I, a survey of complex dynamics around the world in the 1920s and 1930s, a discussion of the dynamical programs of Fatou and Julia during the 1920s and biographical material on several key figures. The book contains graphical renderings of many of the mathematical objects the authors discuss including some of the intriguing fractals Fatou and Julia studied and concludes with several appendices by current researchers in complex dynamics which collectively attest to the impact of the work of Fatou, Julia and others upon the present day study.

Information Processing in Medical Imaging Harrison H. Barrett, 1993-06. This volume contains the proceedings of the thirteenth biennial International Conference on Information Processing in Medical Imaging (IPMI XIII) held on the campus of Northern Arizona University in Flagstaff, Arizona in June 1993. This conference was the latest in a series of meetings where new developments in the acquisition, analysis and utilization of medical images are presented, discussed, dissected and extended. Today IPMI is widely recognized as a preeminent international forum for presentation of cutting edge research in medical imaging and image analysis. The volume contains the text of the papers presented orally at IPMI XIII. Over 100 manuscripts were submitted and critically reviewed of which 35 were selected for presentation. In this volume they are arranged into nine categories: shape description with deformable models, abstract shape description, knowledge based systems, neural networks, novel imaging methods, tomographic reconstruction, image sequences, statistical pattern recognition and image quality.

Saturation: An Efficient Iteration Strategy for Symbolic State-space Generation, 2001. This paper presents a novel algorithm for generating state spaces of asynchronous systems using Multi-valued Decision Diagrams. In contrast to related work, the next state function of a system is not encoded as a single Boolean function but as cross products of integer functions. This permits the application of various iteration strategies to build a system's state space. In particular, this paper introduces a new elegant strategy called saturation and implements it in the tool SMART. On top of usually performing several orders of magnitude faster than existing BDD based state space generators, the algorithm's required peak memory is often close to the total memory needed for storing the overall state spaces.
