Principles Underlying Post-Stroke Recovery of Upper Extremity Sensorimotor Function - A Neuroimaging Perspective Bruno J. Weder, Roland Wiest, Rüdiger J. Seitz, 2016-01-29

Neuroimaging post stroke has the potential to uncover underlying principles of disordered function and recovery characterizing defined patient groups including their long term course as well as individual variations MRI measuring task related activation as well as resting state Functional MRI can be performed by MRI to detect blood flow and associated changes in brain function For structural MRI robust and accurate computational anatomical methods like voxel based morphometry and surface based techniques are available The investigation of the connectivity between brain regions and disruption after stroke is facilitated by diffusion tensor imaging DTI Intra and interhemispheric coherence may be studied by the use of the techniques of electroencephalography and transcranial magnetic stimulation Consecutive phases of stroke recovery acute subacute early chronic and late chronic stages are each distinguished by intrinsic processes The site and size of lesions entail partially different functional implications New strategies to establish a specific function of a lesion site Large scale lesions often imply poor cerebral blood flow which impedes recovery significantly and possibly interferes with BOLD response of functional MRI Thus depending on the site and size of the infarct the patterns of recovery will vary These include in the perilesional area intrinsic compensatory mechanisms using alternative cortical and subcortical pathways or behavioral compensatory strategies eg by using the non affected limb In this context behavioral and neuroimaging measures should be developed and applied to delineate aspects of learning during recovery Of special interest in the recovery of hand paresis is the interplay between sensory and motor areas in the posterior parietal cortex The dominant disability should be from the level of elementary to hierarchically higher processes such as neglect apraxia and motor planning In summary this research covers new trends in state of the art neuroimaging of stroke during recovery from upper limb paresis Integration of behavioral and neuroimaging findings in probabilistic brain atlases
