Basic And Applied Aspects Of Vestibular Function:

Basic and Applied Aspects of Vestibular Function J.C. Hwang,N.G. Daunton,V.J. Wilson,1988-10-01 This volume is the compilation of the series of original articles presentes at the International Symposium on Basic and Applied Aspects of Vestibular Function held in Hong Kong September 13 16 1987 in conjunction with the centenary celebration of the Faculty of Medicine University of Hong Kong The Symposium was jointly sponsored by the University of Hong Kong and the National Aeronautics and Space Administration U S A

Vestibular System Part 2: Psychophysics, Applied Aspects and General Interpretations H.H. Kornhuber,2012-12-06 The function of the vestibular system is not as obvious as those of vision hearing touch or smell Vestibular dysfunction however is clearly apparent where lesions are present It is probably for this reason that the vestibular sense was not discovered until the nineteenth century and that clinicians have continued to play a major role in basic vestibular research right up to the present The relationship between basic and clinical research is certainly stronger in the vestibular field than in that of tactile sensation for instance as testified by the work of clinicians as MENIERE BREUER BARANY DEKLEIJN and FRENZEL In this respect the situation is similar in vestibular physiology and in endocrinology and for the same reason This second part of the vestibular volume of the Handbook of Sensory Physiology will be of interest to neurologists otologists neurosurgeons ophthalmologists and physiotherapists on the one hand and psychologists physiologists engineers and aviation specialists on the other For a full understanding of Part 2 it is necessary to have assimilated the basic anatomy physiology and biochemistry of Part 1

Space/gravitational Biology Accomplishments ,1990 Head Direction Cells and the Neural Mechanisms of Spatial Orientation Sidney I. Wiener, Jeffrey S. Taube, 2005-07-29 A comprehensive examination of head direction signals and their importance in explaining orienting and navigation behaviors Head direction cells neurons that fire only when an animal orients its head in a certain direction are found in several different brain areas with different neurons selective for different head orientations they are influenced by landmarks as well as motor and vestibular information concerning how the head moves through space These properties suggest that head direction cells play an important role in determining orientation in space and in navigation Moreover the prominence strength and clarity of head direction signals indicate their importance over the course of evolution and suggest that they can serve as a vital key for understanding brain function This book presents the latest findings on head direction cells in a comprehensive treatment that will be a valuable reference for students and researchers in the cognitive sciences neuroscience computational science and robotics The book begins by presenting head direction cell properties and an anatomical framework of the head direction system It then looks at the types of sensory and motor information that control head direction cell firing covering topics including the integration of diverse signals the relationship between head direction cell activity and an animal's spatial behavior and spatial and directional orientation in nonhuman primates and humans The book concludes with a tutorial demonstrating the implementation of the continuous attractor network a computational model of head direction cells and an application of this approach for a navigational system for mobile robots **Neurological Rehabilitation** Darcy Ann Umphred, PT, PhD, FAPTA, Rolando T. Artificial Gravity Gilles Clément, Angeli Bukley, 2007-05-28 William H Paloski Ph D Human Adaptation and Countermeasures Office NASA Johnson Space Center Artificial gravity is an old concept having gotten its start in the late in the 19th century when Konstantin Tsiolkovsky considered by many to be the father of the Russian space program realized that the human body might not respond well to the free fall of orbital space flight To solve this problem he proposed that space stations be rotated to create centripetal accelerations that might provide inertial loading similar to terrestrial gravitational loading Einstein later showed in his equivalence principle that acceleration is indeed indistinguishable from gravity Subsequently other individuals of note including scientists like Werner von Braun as well as artists like Arthur C Clarke and Stanley Kubrick devised elaborate solutions for spinning vehicles to provide artificial gravity that would offset the untoward physiological consequences of spaceflight By 1959 concerns about the then unknown human responses to spaceflight drove NASA to consider the necessity of incorporating artificial gravity in its earliest human space vehicles Of course owing in part to the relatively short durations of the planned missions artificial gravity was not used in the early NASA programs
