NMR Spectroscopy Harald Günther, 2013-11-04 Nuclear magnetic resonance NMR spectroscopy is one of the most powerful and widely used techniques in chemical research for investigating structures and dynamics of molecules Advanced methods can even be utilized for structure determinations of biopolymers for example proteins or nucleic acids NMR is also used in medicine for magnetic resonance imaging MRI The method is based on spectral lines of different atomic nuclei that are excited when a strong magnetic field and a radiofrequency transmitter are applied The method is very sensitive to the features of molecular structure because also the neighboring atoms influence the signals from individual nuclei and this is important for determining the 3D structure of molecules This new edition of the popular classic has a clear style and a highly practical mostly non mathematical approach Many examples are taken from organic and organometallic chemistry making this book an invaluable guide to undergraduate and graduate students of organic chemistry biochemistry spectroscopy or physical chemistry and to researchers using this well established and extremely important technique Problems and solutions are included

Surface Architecture of Fungal Pathogens Marcio Rodrigues,2012-05-01 Surface components in fungal cells include cell wall molecules and in certain cases capsular structures In pathogens these components are responsible for key events during interaction with the host These events include recognition of pathogens by the immune system and generation of damage to host cells and tissues The molecular nature of surface structures in fungi is vast and may include glyco proteins polysaccharides lipids and pigments Many of them have been strictly associated with the antifungal immune response as well

as with steps of fungal adhesion and dissemination during interaction with host cells For many fungal pathogens surface composition and architecture are determinant for either disease progression or control The diversity of the composition of the cell surface and its molecular architecture are believed to include targets for the action of new antifungals as well as immunogens with potential to interfere with fungal diseases in favor of the host
