Architecture And Energy:

Architecture and Energy Richard G. Stein,1977 **The Architecture of Energy** Dean Hawkes,Janet Owers,1982

Energy-Efficient Architecture Roberto Gonzalo,Karl J. Habermann,2012-11-05 How is an energy efficient building created

Which are the most important criteria pertaining to urban development or the conception of the floor plan What are the optimal dimensions appropriate for the building s usage but also ensuring energy efficiency Which building elements and systems are most suitable This book systematically explains all relevant criteria and parameters as regards urban development design and the subsequent construction of a sustainable building The immense potential for cutting costs by modernising the energy systems in old buildings is also demonstrated Completed projects are presented according to their usage and are analysed and evaluated in the light of the above criteria For this purpose extensive plans and technical information are used to illustrate the energy profile of each building This shows the particular importance of planning details carefully An annotated subject index concludes the volume

Architecture and Energy William W. Braham,Daniel Willis,2013-07-18 Does energy consumption influence architectural style Should more energy efficient buildings look different Can that look be used to explain or enhance their performance Architecture and Energy provides architects and architectural theorists with more durable arguments for environmental design decisions arguments addressing three different scales or aspects of contemporary construction By drawing together essays from the leading experts in the field this book engages with crucial issues in sustainable design such as The larger role of energy in forming the cultural and economic systems in which architecture is conceived constructed and evaluated The different measures and meanings of energy performance and how those measures are realized in buildings The specific ways in which energy use translates into the visible aspects of architectural style Drawing on research from the UK US Europe and Asia the book outlines the problems surrounding energy and architecture and provides the reader with a considered overview of this important topic

Energy and Environment in Architecture Nick Baker,Koen Steemers,2003-09-02 A unique and revolutionary text which explains the principles behind the LT Method 2 1 a manual design tool developed in Cambridge by the BRE The LT Method is a unique way of estimating the combined energy usage of lighting heating cooling and ventilation systems to enable the designer to make comparisons between options at an early strategic stage In addition Energy and Environment in Architecture the book deals with other environmental issues such as noise thermal comfort and natural ventilation design A variety of case studies provide a critique of real buildings and highlight good practice These topics include thermal comfort noise and natural ventilation

Convergence: An Architectural Agenda for Energy Kiel Moe,2013-07-31 Convergence is based on the thermodynamic premise that architecture should maximize its ecological and architectural power No matter how paradoxical it might initially seem architects should maximize energy intake maximize energy use and maximize energy feedback and reinforcement This presumes that the necessary excess of architecture is in fact an architect s greatest asset when it comes

to an agenda for energy not a liability But how do we start to understand the full range of eco thermodynamic principles which need to be engaged with in order to achieve this Kiel Moe explicates three factors materials energy systems and amortization When these three factors converge through design the resulting buildings begin to perform in complex if not subtle ways By drawing on a range of architectural thermodynamic and ecological sources as well as illustrated and well designed case studies the author shows what architecture stands to gain by simultaneously maximizing the architectural and ecological power of buildings *Energy Accounts* Dan Willis,William Braham,Katsuhiko Muramoto,Daniel Barber,2016-06-23 How does one tell the story of energy production use or conservation in a manner sufficiently convincing to influence policy behavior and design *Energy Accounts* explores potential answers to this question through compelling images data visualizations narratives and other examples of accounting for energy Organized into a collection containing both examples of best practices and critiques this impressive array of projects and contributors combines text and graphic material to explore different representations of energy data Including work from Kieran Timberlake SHoP AMO Lateral Office WOHA and many more the book boasts a unique graphic design which supports and enhances its role as a valuable resource for professionals and students in architecture engineering and urban design *Energy, People, Buildings* Judit Kimpian,Sofie Pelsmakers,Hattie Hartman,2021-03-04 Energy performance feedback is an essential tool in addressing the current climate crisis However this is not simply another theoretical text about energy performance in buildings This book is for anyone who wants to better understand how energy is used in buildings and how to drive down operational energy use whether you re an architect student client building services engineer contractor building operator or other stakeholder Focusing on evidence from feedback on buildings in use it explains what it takes to get them to perform as expected as well as the reasons why they often fail *Energy People Buildings* draws extensively on the findings of studies UK government funded building performance evaluations and on original research into seven case studies from across the UK and abroad that have achieved exemplary energy use through building performance feedback Providing a clear roadmap to understanding aspects that impact building users comfort and satisfaction it also outlines the factors behind energy use and how to track it across the life of a project to ensure that your building performs as intended Case studies include the Everyman Theatre Liverpool Rocky Mountain Institute Innovation Center Colorado and Carrowbreck Meadow Norwich Featured architects AHMM AHR Architype Hamson Barron Smith Haworth Tompkins Henning Larsen Architects and ZGF Architects [The Hierarchy of Energy in Architecture](#) Ravi Srinivasan,Kiel Moe,2015-06-12 The laws of thermodynamics and their implications for architecture have not been fully integrated into architectural design Architecture and building science too often remain constrained by linear concepts and methodologies regarding energy that occlude significant quantities and qualities of energy *The Hierarchy of Energy in Architecture* addresses this situation by providing a clear overview of what energy is and what architects can do with it Building on the emergy method pioneered by systems ecologist

Howard T Odum the authors situate the energy practices of architecture within the hierarchies of energy and the thermodynamics of the large non equilibrium non linear energy systems that drive buildings cities the planet and universe Part of the PocketArchitecture series the book is divided into a fundamentals section which introduces key topics and the emergy methodology and an applications section which features case studies applying emergy to various architectural systems The book provides a concise but rigorous exposure to the system boundaries of the energy systems related to buildings and as such will appeal to professional architects and architecture students Energy Manual Manfred Hegger,Matthias Fuchs,Thomas Stark,Martin Zeumer,2012-12-10 While the efficiency and sustainability offensive is in full swing in most sectors of the economy in the construction sector it is still in its very beginnings economically as well as ecologically However politicians and policymakers at the global European and national levels have begun to address this deficit and are seeking to correct it with legal requirements and laws like EnEV building certifications and competitions Following the proven model of earlier manuals in the series the Energy Manual presents a comprehensive look at the constructional parameters of energy efficiency and sustainability It offers an advance look at the legal regulations being planned by the EU and as a tool ready for immediate use by architects engineers and designers in their daily work it points the way toward the efficient and sustainable construction and operation of buildings With its focus on the entire lifecycle of a building it provides an integrated perspective a necessary prerequisite for sustainable economic management Energy Modelling in Architecture: A Practice Guide Sonja Oliviera,Bill Gething,Elena Marco,2020-07-31 This book offers a practical guide to embedding energy modelling in architectural practice With expert contributions from leading architects and practices this book illustrates architects approaches to learning sharing and integrating energy modelling across a range of design projects in both small and large firms in the UK and internationally Discussing the practical and business implications of embedding energy modelling in practice this is an essential manual for the energy literate architect **An Architecture of Energy** ,1952 *Advancements in Sustainable Architecture and Energy Efficiency* González-Lezcano, Roberto A.,2021-06-18 Thermal comfort and indoor air quality IAQ issues have gained significant interest in the scientific and technical community involved in building performance analysis and other related subjects In terms of thermal comfort the achievement and maintenance of a thermally acceptable indoor environment is affected by energy costs and energy poverty is a widespread problem globally There is a call for energy efficient architecture for a developed and sustainable world However with the use of renewable energy that increased considerably in recent years new technical challenges arose for the energy sector Consumers are key players in this context as flexibility in demand is crucial to cope with the intermittent nature of most renewable energy sources Active demand side participation is particularly important to ensure the efficient use of locally and globally available energy Sustainability human comfort and healthy living environments have become top priorities *Advancements in Sustainable Architecture and Energy Efficiency* explores how housing is a key health factor for

individuals and looks at factors such as air quality ventilation hygrothermal comfort lighting physical environment building efficiency and other areas as important pieces in healthy architecture It discusses how the poor application of these parameters can directly affect human health and how sustainable architecture provides a solution Beyond just labeling the important facets of architecture for healthy living this book will look at different perspectives of energy consumption and demand to ensure sustainable energy increased energy efficiency improved energy policies and reasonable energy costs for homes This book is ideal for architects designers engineers energy engineers environmental scientists practitioners researchers academicians and students interested in architecture that is both conducive to healthy living and energy efficiency

Architectural Energy Efficiency Nasrollahi, Farshad, 2013-06-14 Energy saving in buildings through cost and energy intensive measures such as the application of additional building materials and technologies is only possible with a great consumption of resources and CO₂ emissions for their production For low energy buildings the investment costs including user costs and governmental subsidies are generally high and construction is not always economically viable in consideration of the national capital in the present economic conditions of most countries For these reasons it is first of all necessary to apply cost and resource efficient measures to save energy in buildings and then make use of additional cost and energy intensive measures by improving the thermal envelope the HVAC system or by installing energy generating systems One of the most cost effective and ecological methods of energy saving in buildings is the reduction of energy requirements through climate responsive architecture Due to the fact that energy saving through the optimization of architecture is not only cost neutral resource efficient and carbon neutral but also has a very high energy saving potential the first and most important strategy to save energy should be an optimized and climate responsive design Energy saving through optimized architectural design is economically and ecologically sustainable The development of building simulation science in the last decades has made it easier to study the energy performance of buildings Tools have made it possible to predict the complex behavior of buildings regarding the climate Except for the comparison of different building typologies to find the most efficient there are no other methods to achieve energy savings through the architectural design which can be applied by a variety of building types and climates Therefore in order to encourage the optimization of architectural design it is necessary to improve these methods which represent strategies to significantly reduce the energy demand of buildings Architectural Energy Efficiency is a parametric method which separately studies the effects of various energy related architectural factors on the energy

demand of buildings by using dynamic energy simulations to find the from an energy efficiency point of view optimum value for each of these The architectural factors include orientation building elongation building form opening ratio in different orientations sun shading natural ventilation etc The research process that led to the formulation of the Architectural Energy Efficiency method is based on a series of simulations carried out by a dynamic simulation software tool DesignBuilder to calculate the energy demands of a building with different variants for a single architectural feature The aim of the simulations is to find an optimum set of energy related variables that result in the best and most efficient energy performance for a specific building type and climate This method of efficiency illustrates the effects different architectural features have on the various energy demands of buildings The criteria are derived from the application of this method for a specific building occupation and climate and can be applied in the design process of buildings which leads to improvements of the energy performance and a reduction of resource consumption As the architectural design affects the heating and cooling as well as the lighting energy demands of buildings the optimum value of each factor must be based on these three aspects The heating cooling and lighting energy demands of buildings all behave very differently Therefore these three energy demands together i e the sum of heating cooling and lighting energy must also be applied as a criterion to study the building energy performance and find the optimum value for each architectural feature The criteria for selecting the best variant can not only be based on the total energy demand but should also consider the primary energy demand the CO₂ emissions energy costs for heating cooling and lighting life cycle costs etc The application of these findings to the architectural design of buildings minimizes the energy demand the CO₂ emissions and energy costs of the building does not however affect the initial building costs The advantages of energy saving through optimizing the architectural design are not only the improvement of the building s energy performance but also the fact that the energy saving is cost and resource efficient This means that the energy demand of a building will decrease without increasing the investment costs of the building and without consuming any resources and energy for the production of additional building materials The cost and resource efficiency contributes towards the economic and ecological sustainability of a building during the full life cycle

Architecture - Comfort and Energy M. Sala,C. Gallo,A. A. M. Sayigh,1999-02-22 In this book we seek to approach the architecture energy combination and its relationship to human comfort and the environment There are chapters on thermal comfort low energy architecture dealing with various criterion for comfort in different parts of the World The book also seeks to understand how previous generations lived in harsh climates and without abundant sources of energy yet managed to design and build appropriate dwellings providing both comfort and harmony with the environment Other chapters deal with the bioclimatic concept in Vernacular Architecture the major role which climate plays at different locations and how this can dictate the shape and form of the buildings and save energy the importance of micro climate and its various elements and usage ventilation and its importance in buildings and the technology for modern architecture
