Embedded Systems Architecture for Agile Development Mohsen Mirtalebi, 2017-10-24 Utilize a

new layers based development model for embedded systems using Agile techniques for software architecture and management Firmware is comprised of both hardware and software but the applicability of Agile in embedded systems development is new This book provides a step by step process showing how this is possible The book details how the moving parts in embedded systems development affect one another and shows how to properly use both engineering tools and new tools and methods to reduce waste rework and product time to market Software is seen not as a commodity but a conduit to facilitate valuable product knowledge flow across the company into the hands of the customer Embedded Systems

Architecture for Agile Development starts off by reviewing the Layers model used in other engineering disciplines as well as its advantages and applicability to embedded systems development. It outlines development models from project based methodologies e.g. collaborative product development to the newer modern development visions e.g. Agile in software and various tools and methods that can help with a Layers model implementation. The book covers requirement modeling for embedded systems, Hatley Pirbhai Method and how adapting the HP Method with the help of the tools discussed in this book can be seen as a practical example for a complete embedded system. What You'll Learn: Identify the major software parts involved in building a typical modern firmware. Assign a layer to each software part so each layer can be separate from another and there won't be interdependencies between them. Systematically and logically create these layers based on the customer requirements. Use Model Based Design (MBD) to create an active system architecture that is more accepting of changes. Who This Book Is For: Firmware engineers, systems architects, hardware and software managers, developers, designers and architects, program managers, project managers, Agile practitioners and manufacturing engineers and managers. The secondary audience includes research engineers and managers and engineering and manufacturing managers.

An Architecture of Parts: Architects, Building Workers and Industrialisation in Britain 1940 - 1970 Christine Wall, 2013-07-04. This book is unique in describing the history of post war reconstruction from an entirely new perspective by focusing on the changing relationship between architects and building workers. It considers individual as well as collective interactions with technical change and in doing so brings together for the first time an extraordinary range of sources including technical archives, oral history and visual material to describe the construction process both during and in the decades after the war. It focuses on the social aspects of production and the changes in working life for architects and building workers with increasing industrialization, in particular analysing the effect on the building process of introducing dimensionally coordinated components. Both architects and building workers have been accused of creating a built environment now popularly discredited: architects responsible for poor design and building workers for poor workmanship. However, many of the structures and ideas underpinning this period of rapid change were revolutionary in their commitment to a complete transformation of the building process. *An Architecture of Parts* adds to the growing literature on changes in the building world during and immediately after the Second World War. It is significant both empirically and historically in its examination of the ideas, technology and relationships that fired industrialization of the building process in mid century Britain.
