

Chapter 5 -- Elasticity and Its Application

On this chapter look for the answers to these questions:

- What is elasticity? What kinds of factors can elasticity help us understand?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's responsiveness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

It concerns:

How things respond to some phenomena

How change in price, income, and technology will to consumers can occur.

How price rise bring considering the opportunity cost of your money, the value of having off-going your good or service.

How can it measure how that are want and as many substitutes if you have your good. How many have substitutes? How much will your demand fall or might it even increase?

Elasiticity:

- Some good elasticity measures how much the variable responds changes in another variable.
 - One type of elasticity measures how much demand for other variables will fall if one price goes up.
- Definition: The change in a particular measure of the responsiveness of Q^D or Q^S to one of its determinants.

Price Elasticity of Demand

- Price elasticity of demand measures how much Q^D responds to a change in P .
- Formula: the price elasticity of demand's demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Using a demand curve, B and A move in opposite directions, which means that price elasticity is negative. Use both the change sign and repeat all price elasticity to positive numbers.

Example:

The price elasticity of demand is 0.5. If the price of a good falls by 10%, the quantity demanded will fall by 5%.

Calculating Percentage Changes

Example 1:
Price falls from \$10 to \$5.
Quantity = 100 to 150.

Example 2:
Price falls from \$10 to \$5.
Quantity = 100 to 150.
