Adhesion In Leukocyte Homing And Differentiation:

Adhesion in Leukocyte Homing and Differentiation Dominique Dunon, Charles R. Mackay, Beat A. Imhof, 2012-12-06 This volume of Current Topics in Microbiology and Immunology was planned in parallel with an EM BO workshop on cell cell Interactions in Leukocyte Homing and Differentiation held at the Basel Institute for Immunology in November 1992 and many of the workshop speakers have contributed to it Cell adhesion is one of the most dynamic fields of biological research and presented in this book is the current knowledge on the structure and function of the major families of cell adhesion molecules the integrins the selectins the immunoglobulin superfamily and CD44 Complex interactions between the members of these families mediate diverse adhesion functions including leukocyte leukocyte interactions lymphocyte homing inflammation and lymphocyte stromal cell interaction during hematopoiesis A great deal of emphasis is placed on the regulatory elements that control the expression and function of adhesion molecules Cytokines not only induce the expression of certain adhesion molecules but may also modify their functional status For instance the integrins exist in either an inactive nonfunctional form or an active functional form and a number of intracellular or extracellular stimuli modify integrin function This is particularly important during leukocyte binding to endothelium and transendothelial migration which proceeds through a cascade of adhesion events Although cell adhesion molecules play an important role in many processes this book concentrates on their role within the immune system A number of chapters discuss the migration of lymphocytes between hematopoietic organs such as the thymus lymph nodes Peyer s patches and spleen

Analytical Use of Fluorescent Probes in Oncology Elli Kohen, Joseph G. Hirschberg, 2012-12-06 Fluorescence is a very powerful tool for work at the frontier of cell biology photobiology and bioinstrumentation The stated aim of the workshop was to highlight the significance of fluorescence work for the understanding of cell and tissue physiology physiopathology and pharmacology particularly in terms of the analytical use of fluorescent probes in oncology In the organization of the workshop a multidisciplinary approach was selected The purpose of the Advanced Research Workshop ARW was to bring together researchers in the various disciplines of tissue optics imaging microspectrofluorometry and state of the art probes in order to explore the full benefits that can be derived in biomedicine through the convergence of these approaches When applied to in vivo and in situ studies fluorescence and related optical methods enable us to explore within tissues cells and organelles photon effects previously understood only in solution photochemistry Processes which can be studied at the molecular level by photophysics photochemistry and physical chemistry can be evaluated in living tissue by fluorescence spectroscopy and imaging at the intracellular level in terms of structure and function Thus fluorescence adds a new dimension to cell biology and physiology This approach is now supported by a full and versatile rapidly growing armamentarium of new selective probes for organelles enzymes cations cytoskeleton and metabolic control

Differentiation, Tissue Adaptation and Function of Memory T Cells

Weiguo Cui, Carmen Gerlach, Klaas Van Gisbergen, 2020-06-16 Upon antigen encounter naive T cells differentiate into i effectors that combat infected or malignant cells and at later time points into ii memory cells that provide long lasting immunity This differentiation process allows some T cells to leave the confines of secondary lymphoid organs and to enter peripheral tissues in search of pathogens or tumor cells These different environments pose specific challenges for effector and memory T cells to maintain homeostasis T cells directed into the lungs are likely to encounter higher levels of oxygen but lower amounts of nutrients than those directed into the intestinal epithelium In addition to oxygen tension and nutrient concentrations other key factors such as the commensal flora and stromal components create unique conditions that require tissue specific adaptations of T cells These steady state conditions can dramatically change during infection when inflammatory mediators and T cell growth factors are released requiring the immediate response of T cells The gradual changes imposed by growing tumors can also be challenging for T cells due to competition with rapidly cycling tumor cells that deplete essential resources of oxygen and glucose The strategies that T cells employ to respond to the diverse cues from their surroundings are the focus of current research It appears that next to circulating memory T cells that are confined to the circulation and those that survey all of the peripheral tissues dedicated populations of resident memory T cells exist that can optimally adapt to the local circumstances within each tissue Restrictions on the metabolic requirements of T cells residing in tumor tissue have been found to directly impact on effector functions such as cytokine production The fundamental principles of how the machinery of T cells can translate local cues into tissue specific differentiation processes are fascinating and warrant further investigation
