Böck,2012-12-06 Our knowledge of chromaffin tissue has increased enormously since the last comprehensive treatise in this series was published in 1943 chiefly as a result of the development of new histological methods and technical improvements Less than 40 years have passed since the review by MAX WATZKA and essentially only 25 years were required to accumulate an abundance of revolutionizing findings it was not until 1957 that the carotid body was first studied successfully with the electron microscope In 1962 the technique of formaldehyde induced fluorescence was introduced yielding a view of adrenergic structures that was completely new and far better than that obtained with the chromaffin reaction Immunohistochemistry made it possible to localize enzymes responsible for catecholamine synthesis and to detect peptide hormones Autoradiographic techniques were used at the level of the electron microscope the method of chemical

sympathectomy was introduced and still other technical improvements could be mentioned I myself have been interested in chromaffin cells and sympathetic neurons since 1965 when I entered the Department of Histology University of Vienna as a medical student Therefore I have not followed the developments mentioned above retrospectively but have actually experienced them Anyone who experiences such a development comes to believe that he is well acquainted with the various results and interpretations and is thus capable of objectivity
