Continuous Hemofiltration In The Intensive Care Unit:

Continuous Hemofiltration in the Intensive Care Unit Didier Journois, 1997-09-01 Hemofiltration is now recognised as the optimal therapeutic solution for supplying renal function in patients with acute renal failure associated with poor hemodynamic conditions This situation is often observed in patients with severe impairment in the function of one or several other organs Since its introduction in the intensive care units in the 1970s hemofiltration has been subject to some major improvements regarding the required material and devices such as catheters lines filters or pumps This progress has been accompanied by a better knowledge of the management of patients undergoing the technique especially concerning nutritional support drug administration control of body temperature as well as fluid and electrolytes balance or cost control Moreover some additional beneficial effects of hemofiltration have been recently pointed out suggesting that this technique could provide more than an already efficient renal support by removing some substances responsible for an exagger

Acute Blood Purification H. Suzuki, H. Hirasawa, 2010-05-11 Acute organ damage and the ensuing multiple organ failure are the result of a pathophysiological process involving various cytokines Once activated these proteins cannot be eliminated even when the kidneys function at their maximum capacity To counteract this mechanism researchers in Japan have developed an innovative concept employing blood purification to remove the overwhelming cytokines This book describes the use of hemodiafiltration to inhibit the cytokine storms which cause serious organ damage in patients with septic shock Moreover the technical construction of the blood purification system which includes various machines devices membranes fluids etc is explained in detail Finally leading experts discuss the concept of continuous renal replacement therapy as the standard care in critically ill patients with severe acute kidney injury Describing the current state of acute blood purification this publication provides new impulses and opens new avenues in the treatment of acute organ damage

discusses the KDIGO diagnostic criteria as well as novel experimental findings including in the area of regenerative medicine. It also highlights the clinical pathophysiological importance of AKI in clinical settings including differential diagnoses and management of AKI. In the past the pathology associated with sudden renal impairment was characterized as acute renal failure (ARF). However, in the 2000s the joint efforts of specialists in fields including nephrology, intensive care medicine, and cardiovascular medicine led to the introduction of a novel concept known as acute kidney injury (AKI). As medical care progressed, patients such as high risk elderly subjects who were not deemed to be candidates for invasive therapy came to be treated in intensive care units (ICUs). As a result, kidney injury as a subset of multiple organ failure was reconsidered as AKI, especially in intensive care medicine. AKI was then proposed as a novel disease concept to emphasize the importance of early diagnosis and early intervention to improve prognosis. Presenting novel features such as the definition of AKI risk factors and management biomarkers such as neutrophil gelatinase-associated lipocalin (NGAL) and L-type fatty acid binding protein (L-FABP), long term outcomes of AKI as well as renal regeneration using iPS cell manipulation of embryonic genes and Xenotransplanted embryonic kidney, this book is of interest to all physicians and researchers in this field around the globe.

Blood Purification in Intensive Care C. Ronco, R. Bellomo, Claudio Ronco, G. La Greca, 2001-07. In the last twenty years, critical care medicine has been established as a specialty with its own therapies and procedures with significant implications for clinical nephrology regarding severe acute renal failure. This typically multi-factorial condition is today predominantly seen in intensive care units. The complex knowledge and skills necessary to handle it have resulted in a field called Critical Care Nephrology where nephrologist and intensivist either work side by side or have formally acquired expertise and training in both specialties. Extracorporeal renal replacement therapies, although originally used to treat end stage renal disease, patients rapidly gained importance for acute patients. This has had far reaching implications for the initiation and possible role of blood purification in the management of critically ill patients, widening the scope of interaction between the nephrologist and the intensivist. Experts in the field have contributed to the present book providing a comprehensive review of the different blood purification techniques relevant in the intensive care unit in the case of multiple organ failure. The resulting mix of established knowledge and recent results from both clinical trials and basic research constitutes a valuable tool for all professionals involved in the care of the critically ill patient.
