The Recombinant University draws us deeply into the academic community in the San Francisco Bay Area where the technology was developed and adopted as the first major commercial technology for genetic engineering. In doing so it reveals how research patronage, market forces and legal developments from the late 1960s through the early 1980s influenced the evolution of the technology and reshaped the moral and scientific life of biomedical researchers. Bay Area scientists, university administrators and government officials were fascinated by and increasingly engaged in the economic and political opportunities associated with the privatization of academic research. Yi uncovers how the attempts made by Stanford scientists and administrators to demonstrate the relevance of academic research were increasingly mediated by capitalistic conceptions of knowledge, medical innovation and the public interest. Their interventions resulted in legal shifts and moral realignments that encouraged the privatization of academic research for public benefit. The Recombinant University brings to life the hybrid origin story of biotechnology and the ways the academic culture of science has changed in tandem with the early commercialization of recombinant DNA technology.

Biomedical Visualisation Dongmei Cui, Edgar R. Meyer, Paul M. Rea, 2023-08-30. Curricula in the health sciences have undergone significant change and reform in recent years. The time allocated to anatomical education in medical, osteopathic, medical and other health professional programs has largely decreased. As a result, educators are seeking effective teaching tools and useful technology in their classroom learning. This edited book explores advances in anatomical sciences education such as teaching methods, integration of systems based components, course design and implementation, assessments, effective learning strategies in and outside the learning environment and novel approaches to active learning in and outside the laboratory and classroom. Many of these advances involve computer based technologies. These technologies include virtual reality, augmented reality, mixed reality, digital dissection tables, digital anatomy apps, three dimensional 3D printed models, imaging and 3D reconstruction, virtual microscopy, online teaching platforms, tablet computers and video recording devices, software programs and other innovations. Any of these devices and modalities can be used to develop large class practical guides, small group tutorials, peer teaching and assessment sessions and various products and pathways for guided and self directed learning. The reader will be able to explore useful information pertaining to a variety of topics incorporating these advances in anatomical sciences education. The book will begin with the exploration of a novel approach to teaching dissection based anatomy in the context of organ systems and functional compartments and it will continue with topics ranging from teaching methods and instructional
