Abstract. *Background:* Contemporary estimates of the prevalence of diagnosed osteoporosis among long-term care facility residents are limited. *Methods:* This chart review collected data between April 1, 2012 and August 31, 2013 for adult (age ≥ 50 years) residents of 11 long-term care facilities affiliated with the Louisiana State University Health Sciences Center in the New Orleans metropolitan area. Data (demographics; comorbidities; osteoporosis diagnosis; risk factors; diagnostic assessments; treatments; fracture history; fall risk; activities of daily living) were summarized. Data for residents with and without diagnosed osteoporosis were compared using χ^2 tests and *t* tests. *Results:* The study included 746 residents (69% women, mean [SD] age: 76.3 [13.9] years, median length of stay approximately 18.5 months). An osteoporosis diagnosis was recorded for 132 residents (18%), 30% of whom received a pharmacologic osteoporosis therapy. Fewer than 2% of residents had bone mineral density assessments; 10% had previous fracture. Calcium and vitamin D use was more prevalent in residents with diagnosed osteoporosis compared with other residents (calcium: 49% versus 12%, vitamin D: 52% versus 28%; both $P < 0.0001$). Over half (504/545) of assessed residents had a high fall risk. Activities of daily living were similarly limited regardless of osteoporosis status. *Conclusions:* The prevalence of diagnosed osteoporosis was higher than previously reported for long-term care residents, but lower than epidemiologic estimates of osteoporosis prevalence for the noninstitutional U.S. population. In our sample, osteoporosis diagnostic testing was rare and treatment rates were low. Our results suggest that osteoporosis may be underdiagnosed and undertreated in long-term care settings.

Key Indexing Terms: Long-term care; Osteoporosis; Prevalence. [*Am J Med Sci* 2015;350(5):357–363.]

In the United States, the number of individuals using residential or home-based long-term care is expected to increase from

15 million in 2000 to 27 million by 2050.¹ Although most individuals use home health services, approximately 1.4 million individuals were residing in long-term care facilities in the United States at some point in 2012.² A combination of factors, including a decreasing number of traditional family caregivers as family sizes shrink and more women enter the workforce, is leading to greater use of paid long-term care services, and more than two-thirds of Americans who reach age 65 will need long-term care services during their remaining lifetimes.³

Residents of long-term care facilities are generally of older age, and age is an important osteoporosis risk factor. Previous reports suggest that the prevalence of diagnosed osteoporosis ranges from 6.2% to 12.5% among long-term care residents in the United States although the true prevalence may be higher because of underutilization of osteoporosis screening and treatment in this setting.^{4–6} Even after osteoporosis has been diagnosed, relatively few (25%) of the affected residents receive osteoporosis treatment.^{4–6} Treatment includes regular weight-bearing, muscle-strengthening exercises and pharmacologic therapy.¹¹ Undertreatment of osteoporosis, elevated risk of falls, previous fractures and advanced age all increase the risk that a long-term care resident will experience an osteoporosis-related fracture. The literature suggests that 6% to 11% of long-term care residents will experience a fracture during a 1-year to 3-year interval.^{12–15} Mortality risk may be impacted with up to 42% of affected long-term care residents dying within 2 years after a hip fracture.^{16,17,20}

Despite the significant risk of osteoporosis and associated consequences, the disease burden among long-term care facility residents is not well understood, in part because the literature largely reflects data that are no longer current. As such, this study seeks to narrow this knowledge gap by describing the prevalence of diagnosed osteoporosis among long-term care facility residents and characterizing how osteoporosis is diagnosed and treated in this setting. In addition, this study also quantified the fracture history and risk of falls in this vulnerable population and also the ability of residents to perform activities of daily living (ADL).

METHODS

Data for this study were collected in a retrospective review of medical charts for adults residing in 11 long-term care facilities affiliated with the Louisiana State University Health Sciences Center in New Orleans (LSUHSC-NO). The study was approved by the LSUHSC-NO Institutional Review Board Expedite Status on April 22, 2012 under LSUHSC-NO IRB No. 7951. This project met the criteria for a Waiver of Authorization under the Health Insurance Portability and Accountability Act Privacy Rule.

Data collection was conducted sequentially at each of the 11 study sites between April 1, 2012 and August 31, 2013. This sample represents 11% of the long-term care facilities in the New Orleans Metro area, covered by the 504 area code.²¹
