Terry fills two balloons with the same amount of helium gas. She places one of her helium balloons in the freezer. After twenty minutes, she removes the balloon from the freezer and notices that it is smaller than the balloon that stayed at room temperature. Her balloons are shown above.

How does Terry correctly explain the difference in the size her balloons?

- ☐ A She says that an increase in pressure increases the volume of helium gas.
- ☐ B She says that a decrease in pressure decreases the volume of helium gas.
- ☐ C She says that a decrease in temperature increases the volume of helium gas.
- ☐ D She says that an increase in temperature increase the volume of the helium gas.

2.

Using the periodic table, which of the following properties does Terry list for helium? Select all that apply.

Focus on Earth Science, 2001 *Earth Science*, 2001 *Explainable and Interpretable Reinforcement Learning for Robotics* Aaron M. Roth, Dinesh Manocha, Ram D. Sriram, Elham Tabassi, 2024-03-19 This book surveys the state of the art in explainable and interpretable reinforcement learning RL as relevant for robotics While RL in general has grown in popularity and been applied to increasingly complex problems several challenges have impeded the real world adoption of RL algorithms for robotics and related areas These include difficulties in preventing safety constraints from being violated and the issues faced by systems operators who desire explainable policies and actions Robotics applications present a unique set of considerations and result in a number of opportunities related to their physical real world sensory input and interactions The authors consider classification techniques used in past surveys and papers and attempt to unify terminology across the field The book provides an in depth exploration of 12 attributes that can be used to classify explainable interpretable techniques These include whether the RL method is model agnostic or model specific self explainable or post hoc as well as additional analysis of the attributes of scope when produced format knowledge limits explanation accuracy audience predictability legibility readability and reactivity The book is organized around a discussion of these methods broken down into 42 categories and subcategories where each category can be classified according to some of the attributes The authors close by identifying gaps in the current research and highlighting areas for future investigation **Sound and Light** Michael J. Padilla, Ioannis Miaoulis, Martha Cyr, Jay M. Pasachoff, 2002 **Reinforcement Learning and Stochastic Optimization** Warren B. Powell, 2022-04-25 REINFORCEMENT LEARNING AND STOCHASTIC OPTIMIZATION Clearing the jungle of stochastic optimization Sequential decision problems which consist of decision information decision information are ubiquitous spanning virtually every human activity ranging from business applications health personal and public health and medical decision making energy the sciences all fields of engineering finance and e commerce The diversity of applications attracted the attention of at least 15 distinct fields of research using eight distinct notational systems which produced a vast array of analytical tools A byproduct is that powerful tools developed in one community may be unknown to other communities Reinforcement Learning and Stochastic Optimization offers a single canonical framework that can model any sequential decision problem using five core components state variables decision variables exogenous information variables transition function and objective function This book highlights twelve types of uncertainty that might enter any model and pulls together the diverse set of methods for making decisions known as policies into four fundamental classes that span every method suggested in the academic literature or used in practice Reinforcement Learning and Stochastic Optimization is the first book to provide a balanced treatment of the different methods for modeling and solving sequential decision problems following the style used by most books on machine learning optimization and simulation The presentation is designed for readers with a course in probability and statistics and an interest in modeling and applications Linear

programming is occasionally used for specific problem classes The book is designed for readers who are new to the field as well as those with some background in optimization under uncertainty Throughout this book readers will find references to over 100 different applications spanning pure learning problems dynamic resource allocation problems general state dependent problems and hybrid learning resource allocation problems such as those that arose in the COVID pandemic There are 370 exercises organized into seven groups ranging from review questions modeling computation problem solving theory programming exercises and a diary problem that a reader chooses at the beginning of the book and which is used as a basis for questions throughout the rest of the book

Insights in Reinforcement Learning, 2011 A key aspect of artificial intelligence is the ability to learn from experience If examples of correct solutions exist supervised learning techniques can be used to predict what the correct solution will be for future observations However often such examples are not readily available The field of reinforcement learning investigates methods that can learn from experience when no examples of correct behavior are given but a reinforcement signal is supplied to the learning entity Many problems fit this problem description In games the reinforcement signal might be whether or not the game was won In economic settings the reinforcement can represent the profit or loss that is eventually made Furthermore in robotics it is often easier to specify how well the robot is doing than it is to find examples of good behavior beforehand An advantage of reinforcement learning is that the designer of the system need not know what good solutions to a problem may be Rather the system will find good solutions by trial and error Of particular interest to us are model free temporal difference algorithms These algorithms do not use experiences to build an explicit model of the environment but construct an approximation of the expected value for each possible action The values can then be used to construct solutions These methods are computationally efficient easy to implement and often find solutions quickly Additionally in many settings it is easier to find a good policy to select actions than to model the whole environment and then to use this model to try to determine what to do In this dissertation we analyze several existing model free temporal difference algorithms We discuss some problems with these approaches such as a potentially huge overestimation of the action values by the popular Q learning algorithm We discuss ways to prevent these issues and propose a number of new algorithms We analyze the new algorithms and compare their performance on a number of tasks We conclude that it depends highly on the characteristics of the problem which algorithm performs best We give some indications on which algorithms are to be preferred in different problem settings To solve problems with unknown characteristics we propose using ensemble methods that combine action selection policies of a number of different entities We discuss several approaches to combine these policies and demonstrate empirically that good solutions can reliably be found Additionally we extend the idea of model free temporal difference algorithms to problems with continuous action spaces In such problems conventional approaches are not applicable because they can not handle the infinite number of possible actions We propose a new algorithm that is explicitly designed for continuous spaces and show that it compares

favorably to the current state of the art Reinforcement Learning - Principles, Concepts and Applications Bhavatarini N,Syed Thouheed Ahmed,Syed Muzamil Basha,2024-03-25 Reinforcement learning RL is a subfield of machine learning that deals with how an agent should learn to take actions in an environment to maximize some notion of cumulative reward In other words reinforcement learning is a learning paradigm where an agent learns to interact with an environment by taking actions and observing the feedback it receives in the form of rewards or penalties It is a feedback based Machine learning technique in which an agent learns to behave in an environment by performing the actions and seeing the results of actions For each good action the agent gets positive feedback and for each bad action the agent gets negative feedback or penalty

How to Enhance Learning Efficiency When Online Learning is Popular and Indispensable: Theory, Research and Practice Rong Lian, Chang Liu, Juzhe Xi, 2024-07-17 Online learning has become more and more common globally whether for comfort adapting to work hours or just having the freedom to study from anywhere And now under the coronavirus pandemic as people are having to stay at home it has become more important than ever Although the popularity of wireless network and portable smart device makes it possible for people to acquire and learn knowledge anytime and anywhere it does not necessarily mean an increased learning performance Relevant research in cognitive science has revealed possible limitations in online learning For example the knowledge acquired through online learning tends to be fragmented and lacks guidance for integrated thinking among different subjects which makes it difficult for learners to form a systematic knowledge structure Learners may experience cognitive overload metacognitive illusion and low learning efficiency in self regulated learning It follows that in the post COVID 19 era online learning puts forward new requirements and challenges to the contemporary students not only to their learning strategies but positive character traits in learning Most of the current learning theories were developed in the early 20th century and may not fit in well with the current situation then possibly leading to inefficient learning and increased learning burden Therefore it is necessary and important to reexplore the influencing factors and mechanisms that affect the learning efficiency of students at all levels nowadays

based on which we could construct a theoretical model of efficient learning model
