SECOND EDITION

edited by John R. Heckenlively and Geoffrey B. Arden

Visual evoked potentials (VEPs) are a type of electroencephalogram (EEG) that measure the electrical activity of the visual cortex in response to a visual stimulus. They are used to assess the integrity of the visual pathway, from the retina to the visual cortex. VEPs are typically recorded from the occipital region of the scalp. The visual stimulus can be a flash of light, a pattern of light, or a moving visual stimulus. The VEP waveform consists of a series of peaks and troughs, which represent the electrical activity of the visual cortex. The amplitude of the VEP is a measure of the strength of the visual pathway. VEPs are used in a variety of clinical applications, including the diagnosis of visual pathway disorders, the monitoring of visual pathway function during surgery, and the assessment of visual pathway function in patients with neurological disorders.

*Handbook of Clinical Electrophysiology of Vision* Minzhong Yu, Donnell Creel, Alessandro Iannaccone, 2019-12-26 This book provides an analytical and thorough review of clinical electrophysiology of vision and the progress made in the field in the past decade. *Handbook of Clinical Electrophysiology of Vision* is designed to aid the readers in understanding the types of electrophysiologic tests that should be used in specific diseases, how to explain the results of these exams, and how to perform the tests of clinical electrophysiology of vision. Concise in format, the *Handbook of Clinical Electrophysiology of Vision* is divided into two sections that discuss a wide range of relevant topics such as technology of electroretinography, electrooculography, visual evoked potential, characteristics of electroretinography in retinal diseases, and the characteristics of optic nerve diseases. Part one begins with a discussion on the basic theory of electrophysiology of vision, illustrating physiologic sources of electrophysiological responses, the techniques of the recording and analysis of electrophysiologic signals. Part two then dives into the clinical application of electrophysiology of vision and subsequently summarizes the characteristics of the electrophysiological signals in a number of disorders of retina and optic nerve. Written by experts in the field, *Handbook of Clinical Electrophysiology of Vision* is an invaluable resource for ophthalmologists, optometrists, electrophysiologists, residents, fellows, researchers, technicians, and students in ophthalmology, optometry, and vision science.

**Techniques in Clinical Electrophysiology of Vision** G. Niemeyer, Ch. Huber, 1982-06-30. Proceedings of the 19th ISCEV Symposium, Horgen, Switzerland, June 1-5, 1981. *Principles and Practice of Clinical Electrophysiology of Vision, second edition* John R. Heckenlively, Geoffrey B. Arden, 2006-04-07. The long-awaited second edition of an authoritative reference on electrophysiologic vision testing, including detailed information on techniques and problems, basic physiology, and anatomy, theoretical concepts, and clinical findings, with extensive new material. This authoritative text is the only comprehensive reference available on electrophysiologic vision testing, offering both practical information on techniques and problems as well as basic physiology and anatomy, theoretical concepts, and clinical correlations. The second edition of the widely used text offers extensive new material and updated information. 65 of the 84 chapters are completely new, with the changes reflecting recent advances in the field. The book will continue to be an essential resource for practitioners and scholars from a range of disciplines within vision science. The contributions not only cover new information, important material that is likely to become more important in the next decade, but also offer a long-range perspective on the field and its remarkable development in the last century. After discussing the history and background of clinical electrophysiology, the book introduces the anatomy of the retina and principles of cell biology in the visual pathways at the molecular, physiological, and biochemical levels. It relates these new findings to the techniques and interpretations of clinical tests, including the electrooculogram (EOG), electroretinogram (ERG), and visual evoked potentials (VEP), which are discussed in detail, as are equipment, data acquisition, and analysis principles and protocols for clinical testing, diseases, and dysfunction, and animal

Oscillatory Event-Related Brain Dynamics Christo Pantev,Thomas Elbert,Bernd Lütkenhöner,2013-11-21 How does the brain code and process incoming information how does it recognize a certain object how does a certain Gestalt come into our awareness One of the key issues to conscious realization of an object of a Gestalt is the attention devoted to the corresponding sensory input which evokes the neural pattern underlying the Gestalt This requires that the attention be devoted to one set of objects at a time However the attention may be switched quickly between different objects or ongoing input processes It is to be expected that such mechanisms are reflected in the neural dynamics Neurons or neuronal assemblies which pertain to one object may fire possibly in rapid bursts at a time Such firing bursts may enhance the synaptic strength in the corresponding cell assembly and thereby form the substrate of short term memory However we may well become aware of two different objects at a time How can we avoid that the firing patterns which may relate to say a certain type of movement columns in V5 or to a color V4 of one object do not become mixed with those of another object Such a blend may only happen if the presentation times become very short below 20-30 ms One possibility is that neurons pertaining to one cell assembly fire synchronously Then different cell assemblies firing at different rates may code different information
