

Designing and Manufacturing Architecture in the Digital Age

ROBERTO DI CARO, Brunel
University of Portsmouth, UK
<http://www.spsn.brunel.ac.uk/>

The paper describes and examines the implications of the recent developments in the architectural application of the latest digital design and fabrication technologies, which offer alternatives to the established understandings of architectural design and production processes and their material and economic constraints. It offers a possibility of a revised understanding of the historic relationship between architecture and its means of production.

Keywords: Digital design, Digital fabrication, CAD/CAM.

Introduction

"Having abandoned the discourse of style, the architecture of modern times is characterized by its capacity to take advantage of the specific achievements of that same modernity: the innovations offered it by present-day science and technology. This relationship between new technology and new architecture even comprises a fundamental datum of what are referred to as avant-garde architectures, so fundamental as to constitute a dominant albeit diffuse motif in the figuration of new architectures."

Ignasi de Sola Morales (1997)

The Information Age, like the Industrial Age before it, is challenging not only how we design buildings, but also how we manufacture and construct them. In the conceptual realm, computational digital architectures of topological, non-Euclidean geometric space, kinetic and dynamic systems, and genetic algorithms, are supplanting technological architectures. Digitally driven design processes characterized by dynamic, open-ended and unpredictable but consistent transformations of three-dimensional structures are giving rise to new architectural possibilities (Kolarevic 2000). The generative and creative potential of digital media, together with manufacturing advances already attained in automotive, aerospace and shipbuilding

industries, is opening up new dimensions in architectural design. The implications are vast, as "architecture is receding itself, becoming in part an experimental investigation of topological geometries, partly a computational orchestration of robotic material production and partly a generative, kinematic sculpting of space," as observed by Peter Zeller in "Hybrid Space" (1999).

It was only within the last few years that the advances in computer-aided design (CAD) and computer-aided manufacturing (CAM) technologies have started to have an impact on building design and construction practices. They opened up new opportunities by allowing production and construction of very complex forms that were until recently very difficult and expensive to design, produce, and assemble using traditional construction technologies. The consequences will be profound, as the historic relationship between architecture and its means of production is increasingly being challenged by new digitally driven processes of design, fabrication and construction.

Digital Architectures

The new digital approaches to architectural design (digital architectures) are based on computational concepts such as topological space (topological architectures), isomorphic surfaces (isomorphic
