INNOVATIVE INDUSTRIAL INFORMATICS IN EMBEDDED SYSTEMS

A NOVEL AREA-EFFICIENT VLSI ARCHITECTURE FOR RECURSION COMPUTATION IN LTE TURBO DECODERS

ABSTRACT:

Long-term evolution (lte) is aimed to achieve the Peak data rates in excess of 300 mb/s for the next-generation wireless Communication systems. Turbo codes, the specified channelcoding Scheme in lte, suffer from a low-decoding throughput Due to its iterative decoding algorithm. One efficient approach To achieve a promising throughput is to use multiple maximum A posteriori (map) cores in parallel, resulting in a large area Overhead. The two computationally challenging units in an map Core are α and β recursion units. Although several methods have Been proposed to shorten the critical path of these recursion units, Their area-efficient architecture with minimum silicon area is still Missing. In this brief, a novel relation existing between the α and β metrics is introduced, leading to a novel add-compare-select (acs) architecture. The proposed technique can be applied to both The precise approximation of log-map and max-log-map acs Architectures. The proposed acs design, which is implemented In a 0.13- μm cmos technology and customized for the lte Standard, results in, at most, 18.1% less area compared with the Reported designs to date while maintaining the same throughput Level.
