Controversies in Cardiovascular Anesthesia Phillip Fyman, Alexander W. Gotta, 2012-12-06 On 16 October 1846 an itinerant New England dentist named William T G Morton proved the anesthetic effect of diethyl ether in a public demonstration in the ether dome of the Bulfinch Building of the Massachusetts General Hospital in Boston The patient Gilbert Abbott suffered no pain and the surgeon Dr John C Warren was able to complete a suture ligation of a vascular tumor of the jaw without the hurry that until then was so necessary The operation proved a failure since the tumor recurred but the demonstration of ether's anesthetic effect was a great success Operative pain was conquered and surgery could advance from a crude and unscientific practice where speed was paramount and the major body cavities could not be entered into the unique blend of science and art that it is now Gentlemen this is no humbug supposedly muttered Warren perhaps the last noncontroversial assessment of anesthesiology to be made by a surgeon The screams of resisting patients in pain were stilled and quiet entered the operating room for the first time But the new science of pain relief was quickly wrapped in controversy An argument immediately arose as to who could legitimately claim primacy for the discovery Morton's attempt to hide the true nature of his anesthetic agent coupled with an effort to patent the discovery clouded his reputation and stimulated other claimants to push themselves forward

[Augmentation of Brain Function: Facts, Fiction and Controversy](#) Manuel F. Casanova,Mikhail Lebedev,Ioan Opris ,2018-09-14 The final volume in this tripartite series on Brain Augmentation is entitled *From Clinical Applications to Ethical Issues and Futuristic Ideas*

Many of the articles within this volume deal with translational efforts taking the results of experiments on laboratory animals and applying them to humans. In many cases these interventions are intended to help people with disabilities in such a way so as to either restore or extend brain function. Traditionally, therapies in brain augmentation have included electrical and pharmacological techniques. In contrast, some of the techniques discussed in this volume add specificity by targeting select neural populations. This approach opens the door to where and how to promote the best interventions. Along the way, results have empowered the medical profession by expanding their understanding of brain function. Articles in this volume relate novel clinical solutions for a host of neurological and psychiatric conditions such as stroke, Parkinson's disease, Huntington's disease, epilepsy, dementia, Alzheimer's disease, autism spectrum disorders, ASD, traumatic brain injury, and disorders of consciousness. In disease symptoms and signs denote a departure from normal function. Brain augmentation has now been used to target both the core symptoms that provide specificity in the diagnosis of a disease as well as other constitutional symptoms that may greatly handicap the individual. The volume provides a report on the use of repetitive transcranial magnetic stimulation (rTMS) in ASD with reported improvements of core deficits, i.e., executive functions. TMS in this regard departs from the present-day trend towards symptomatic treatment that leaves unaltered the root cause of the condition. In diseases such as schizophrenia, brain augmentation approaches hold promise to avoid lengthy pharmacological interventions that are usually riddled with side effects or those with limiting returns as in the case of Parkinson's disease. Brain stimulation can also be used to treat auditory verbal hallucination, visuospatial hemispatial neglect, and pain in patients suffering from multiple sclerosis. The brain acts as a telecommunication transceiver wherein different bandwidths of frequencies, brainwave oscillations, transmit information. Their baseline levels correlate with certain behavioral states. The proper integration of brain oscillations provides for the phenomenon of binding and central coherence. Brain augmentation may foster the normalization of brain oscillations in nervous system disorders. These techniques hold the promise of being applied remotely under the supervision of medical personnel, thus overcoming the obstacle of travel in order to obtain healthcare. At present, traditional thinking would argue the possibility of synergism among different modalities of brain augmentation as a way of increasing their overall effectiveness and improving therapeutic selectivity. Thinking outside of the box would also provide for the implementation of brain-to-brain interfaces where techniques proper to artificial intelligence could allow us to surpass the limits of natural selection or enable communications between several individual brains sharing memories or even a global brain capable of self-organization. Not all brains are created equal. Brain stimulation studies suggest large individual variability in response that may affect overall recovery, treatment, or modify desired effects of a given intervention. The subject's age, gender, hormonal levels may affect an individual's cortical excitability. In addition, this volume discusses the role of social interactions in the operations of augmenting technologies. Finally, augmenting methods could be applied to modulate consciousness even though its neural mechanisms are poorly understood. Finally, this volume should be taken as a debate on

social moral and ethical issues on neurotechnologies Brain enhancement may transform the individual into someone or something else These techniques bypass the usual routes of accommodation to environmental exigencies that exalted our personal fortitude learning exercising and diet This will allow humans to preselect desired characteristics and realize consequent rewards without having to overcome adversity through more laborious means The concern is that humans may be playing God and the possibility of an expanding gap in social equity where brain enhancements may be selectively available to the wealthier individuals These issues are discussed by a number of articles in this volume Also discussed are the relationship between the diminishment and enhancement following the application of brain augmenting technologies the problem of mind control with BMI technologies free will the duty to use cognitive enhancers in high responsibility professions determining the population of people in need of brain enhancement informed public policy cognitive biases and the hype caused by the development of brain augmenting approaches
