Contemporary Theory Of Par Diff Equ:

Basic Modern Theory of Linear Complex Analytic q -Difference Equations Jacques Sauloy, 2024-11-06 The roots of the modern theories of differential and q difference equations go back in part to an article by George D Birkhoff published in 1913 dealing with the three sister theories of differential difference and q difference equations This book is about q difference equations and focuses on techniques inspired by differential equations in line with Birkhoff's work as revived over the last three decades It follows the approach of the Ramis school mixing algebraic and analytic methods While it uses some q calculus and is illustrated by q special functions these are not its main subjects After a gentle historical introduction with emphasis on mathematics and a thorough study of basic problems such as elementary q functions elementary q calculus and low order equations a detailed algebraic and analytic study of scalar equations is followed by the usual process of transforming them into systems and back again The structural algebraic and analytic properties of systems are then described using q difference modules Newton polygon filtration by the slopes The final chapters deal with Fuchsian and irregular equations and systems including their resolution classification Riemann Hilbert correspondence and Galois theory Nine appendices complete the book and aim to help the reader by providing some fundamental yet not universally taught facts There are 535 exercises of various styles and levels of difficulty The main prerequisites are general algebra and analysis as taught in the first three years of university The book will be of interest to expert and non expert researchers as well as graduate students in mathematics and physics

Integral Geometry and Convolution Equations V.V.

Volchkov, 2012-12-06 Integral geometry deals with the problem of determining functions by their integrals over given families of sets. These integrals define the corresponding integral transform and one of the main questions in integral geometry asks when this transform is injective. On the other hand, when we work with complex measures or forms, operators appear whose kernels are non-trivial but which describe important classes of functions. Most of the questions arising here relate in one way or another to the convolution equations. Some of the well-known publications in this field include the works by J. Radon, F. John, J. Delsarte, L. Zalcman, C. A. Berenstein, M. L. Agranovsky, and recent monographs by L. Hörmander and S. Helgason. Until recently, research in this area was carried out mostly using the technique of the Fourier transform and corresponding methods of complex analysis. In recent years, the present author has worked out an essentially different methodology based on the description of various function spaces in terms of expansions in special functions, which has enabled him to establish best possible results in several well-known problems.

Modern Methods in Partial Differential Equations Martin

Modern Methods in Operator Theory and Harmonic Analysis Alexey

Karapetyants, Vladislav Kravchenko, Elijah Liflyand, 2019-08-28 This proceedings volume gathers selected peer-reviewed papers from the Modern Methods Problems and Applications of Operator Theory and Harmonic Analysis VIII OTHA 2018 conference, which was held in Rostov-on-Don, Russia, in April 2018. The book covers a diverse range of topics in advanced mathematics, including harmonic analysis, functional analysis, operator theory, function theory, differential equations, and fractional analysis, all fields that have been intensively developed in recent decades. Direct and inverse problems arising in mathematical physics are studied, and new methods for solving them are presented. Complex multiparameter objects that require the involvement of operators with variable parameters and functional spaces with fractional and even variable exponents make these approaches all the more relevant. Given its scope, the book will especially benefit researchers with an interest in new trends in harmonic analysis and operator theory, though it will also appeal to graduate students seeking new and intriguing topics for further investigation.

It presents recent results in Fredholm theory for singular integral and convolution operators, estimates for singular integral operators on Carleson curves acting in L_p spaces with variable exponents, the finite sections method for band-dominated and Toeplitz operators, Szegő-type theorems, the averaging method for nonlinear equations, among others.

Coupled Electromagnetic Field/Circuit Simulation. Modeling and Numerical Analysis Sascha Baumanns, 2012 Today s most commonly used circuit models increasingly tend to lose their validity in circuit simulation due to rapid technological developments miniaturization and increased complexity of integrated circuits The starting point of this

thesis was to tackle these challenges by refining the critical parts of the circuit by combining circuit simulation directly with distributed device models The approach set out in this thesis couples partial differential equations for electromagnetic devices modeled by Maxwell's equations to differential algebraic equations which describe basic circuit elements including memristors and the circuit's topology First Maxwell's equations are spatially discretized and a potential formulation is derived the coupled system is then formulated as a differential algebraic equation with a properly stated leading term and analyzed Topological and modeling conditions are presented to guarantee the tractability index of these differential algebraic equations to be no greater than two Finally local solvability perturbation results and an algorithm to calculate consistent initializations are derived for a general class of differential algebraic equations with a properly stated leading term having tractability index 2

Control Theory for Partial Differential Equations: Volume 1, Abstract Parabolic Systems Irena Lasiecka, Roberto Triggiani, 2000-02-13 Originally published in 2000 this is the first volume of a comprehensive two volume treatment of quadratic optimal control theory for partial differential equations over a finite or infinite time horizon and related differential integral and algebraic Riccati equations Both continuous theory and numerical approximation theory are included The authors use an abstract space operator theoretic approach which is based on semigroups methods and which is unifying across a few basic classes of evolution The various abstract frameworks are motivated by and ultimately directed to partial differential equations with boundary point control Volume 1 includes the abstract parabolic theory for the finite and infinite cases and corresponding PDE illustrations as well as various abstract hyperbolic settings in the finite case It presents numerous fascinating results These volumes will appeal to graduate students and researchers in pure and applied mathematics and theoretical engineering with an interest in optimal control problems
