

Contested Domains, Fragmented Spaces: rights, responsibilities and rewards for conserving biodiversity and associated knowledge systems

Anil K Gupta and Riya Sinha

Administrative or legal boundaries make little sense while understanding the evolution of nature, its diversity, complexity and simultaneity. And yet we live in a world in which most decisions have to be taken along these boundaries. Obviously, fragmentation of landscapes, eco-systems, and biospheres along artificial boundaries does impair our ability to let the socio-ecological interactions be monitored or managed in a most sustainable manner. But then one should not let the best solution become the enemy of the better. It is necessary thus to understand how property rights over natural resources and also the associated knowledge systems help in dealing with contested domains of knowledge, resources, and related rights and responsibilities. Rewards for these rights holders may help in modifying the incentives for conservation.

In this paper, we first explain the conceptual framework of contested domains among private, community and public domain of knowledge and resources in part one. We present the summary of the discussion in the recent meeting of Intergovernmental committee on Intellectual Property and genetic Resources, Traditional Knowledge and Folklore (April 30 to May 3, 2001, held at WIPO, Geneva and review some other studies on the IPR rights of local communities and individuals to assess the effectiveness of various incentive mechanisms in second part. In part three we conclude by identifying certain lessons from Honey Bee network to help knowledge rich economically poor people in conserving and augmenting biodiversity without having to remain poor.

Part I : Contested Domains, Fragmented Spaces

A bird flies across the sky over a private home garden, community forest, public forest and the sea beyond. So do fish or other wild life move across different resource regimes. Can we conserve wildlife only by conserving protected areas and biospheres. McDonald, Aragutainaq and Novalinga (2001) provide an interesting example of how the interconnections among different parts of ecosystems influence the way we perceive the environment and its components. The ecological indicators have been used by the communities from time immemorial to interconnect various biological, meteorological, edaphic and aquatic resources and information. In the western Hudson Bay, local Cree and Inuit communities forecast weather and seasonal characteristics by looking at the behaviour of birds, clouds, winds etc., This is a complicated knowledge system in which biodiversity based knowledge system are produced in conjunction with other kinds of knowledge. In a recent conference to discuss criteria and indicators of sustainability, the issue of local knowledge and indigenous indicators emerged quite strongly (Gupta 2001). Within biodiversity, the complexity is no less. The taxonomists have named hardly 1.4 million species out of estimated 10-100 million species in the world (WCMC 1992). Even among the known species, certain regions and certain categories are far more researched than others. Different stakeholders value different species variously and thus have asymmetric interest in their conservation (Koziell, 2001, Gupta 1995, Suthersanen 1999: 72-77). Pimental et al (1992) estimate that about only 35-40 per cent of total 30,000 species in Germany were found in protected areas. Even the
