Continents in Collision Russell Miller, Time-Life Books, 1983 Presents evidence supporting Alfred Wegener's theory of continental drift Explains plate tectonics and discusses what is known of the earth's crust and upper mantle

Arc-Continent Collision Dennis Brown, Paul D. Ryan, 2011-06-29 Arc continent collision has been one of the important tectonic processes in the formation of mountain belts throughout geological time and it continues to be so today along tectonically active plate boundaries such as those in the SW Pacific or the Caribbean Arc continent collision is thought to have been one of the most important process involved in the growth of the continental crust over geological time and may also play an important role in its recycling back into the mantle via subduction Understanding the geological processes that take place during arc continent collision is therefore of importance for our understanding of how collisional orogens evolve and how the continental crust grows or is destroyed Furthermore zones of arc continent collision are producers of much of the world's primary economic wealth in the form of minerals so understanding the processes that take place during these tectonic events is of importance in modeling how this mineral wealth is formed and preserved This book brings together seventeen papers that are dedicated to the investigation of the tectonic processes that take place during arc continent collision It is divided into four sections that deal firstly with the main players involved in any arc continent collision the continental margin the subduction zone and finally the volcanic arc and its mineral deposits The second section presents eight examples of arc continent collisions that range from being currently active through to Palaeoproterozoic in age The third section contains two papers one that deals with the obduction of large slab ophiolites and a second that presents a wide range of physical models of arc continent collision The fourth section brings everything that comes before together into a discussion of the processes of arc continent collision

One Moon, One Civilization. Why the Moon tells us we are alone in the Universe Jorge Laborda, 2010-12-08 Whether or not we are alone in the universe remains one of the most fascinating enigmas of science Accumulated scientific knowledge despite revealing that there are billions of galaxies and probably billions of billions of planets suggests that for practical purposes most likely we are alone This book examines this issue in a comprehensive way In particular among other issues it discusses why it is unlikely that life could be based on chemistry different from ours in the known universe It also reviews the extraordinary origin of the Moon which makes it very unlikely that other planets may possess moons similar to ours and it discusses why its presence orbiting Earth has been decisive for the emergence and evolution of intelligent beings that are here now reading these lines
